Name: Alex Johnson Date: 9/18/19

I pledge my honor that I have abided by the Stevens Honor System.

Point values are assigned for each question.

Points earned: ____ / 100, = ____ %

1. Find an upper bound for $f(n) = n^4 + 10n^2 + 5$. Write your answer here: $O(n^4)$ (4 points)

Prove your answer by giving values for the constants c and n_0 . Choose the smallest integral value possible for c. (4 points)

$$n^4 + 10n^2 + 5 \le 2n^4$$

 $c = 2$
 $n_0 = 11$

2. Find an asymptotically tight bound for $f(n) = 3n^3 - 2n$. Write your answer here: $\theta(n^2)$ (4 points)

Prove your answer by giving values for the constants c_1 , c_2 , and n_0 . Choose the tightest integral values possible for c_1 and c_2 . (6 points)

$$2n^{3} \le 3n^{3} - 2n \le 4n^{3}$$
 $c_{1} = 2$
 $c_{2} = 4$
 $n_{0} = 2$

3. Is $3n - 4 \in \Omega(n^2)$? Circle your answer: yes / no. (2 points)

If yes, prove your answer by giving values for the constants c and n_0 . Choose the smallest integral value possible for c. If no, derive a contradiction. (4 points)

$$3n - 4 \ge n^2$$
$$for n = 3$$
$$3(3) - 4! \ge 3^2$$

4. Write the following asymptotic efficiency classes in **increasing** order of magnitude. $O(n^2)$, $O(2^n)$, O(1), $O(n \lg n)$, O(n), O(n!), $O(n^3)$, $O(\lg n)$, $O(n^n)$, $O(n^2 \lg n)$ (2 points each)

$$O(1), O(\log n), O(n), O(n\log n), O(n^2), O(n^2\log n), O(n^3), O(2^n), O(n!), O(n^n)$$

- 5. Determine the largest size n of a problem that can be solved in time t, assuming that the algorithm takes f(n) milliseconds. n must be an integer. (2 points each)
 - a. f(n) = n, t = 1 second 1,000
 - b. $f(n) = n \lg n$, t = 1 hour 204,094
 - c. $f(n) = n^2$, t = 1 hour 1,897

```
d. f(n) = n^3, t = 1 day 442
```

- e. f(n) = n!, t = 1 minute 7
- 6. Suppose we are comparing two sorting algorithms and that for all inputs of size n the first algorithm runs in $4n^3$ seconds, while the second algorithm runs in 64n lg n seconds. For which integral values of n does the first algorithm beat the second algorithm? $2 \le n \le 6$ (4 points) Explain how you got your answer or paste code that solves the problem (2 point):
 - I graphed the two functions and found their points of intersection.
- 7. Give the complexity of the following methods. Choose the most appropriate notation from among O, Θ , and Ω . (8 points each)

```
int function1(int n) {
    int count = 0;
    for (int i = n / 2; i <= n; i++) {</pre>
         for (int j = 1; j <= n; j *= 2) {
              count++;
         }
    return count;
Answer: \theta(nlgn)
int function2(int n) {
    int count = 0;
    for (int i = 1; i * i * i <= n; i++) {</pre>
         count++;
    return count;
}
Answer: \theta(\sqrt[3]{n})
int function3(int n) {
    int count = 0;
    for (int i = 1; i <= n; i++) {</pre>
         for (int j = 1; j <= n; j++) {</pre>
              for (int k = 1; k <= n; k++) {</pre>
                  count++;
              }
         }
    return count;
Answer: \theta(n^3)
```

```
int function4(int n) {
    int count = 0;
    for (int i = 1; i <= n; i++) {</pre>
        for (int j = 1; j <= n; j++) {
             count++;
             break;
         }
    return count;
Answer: \theta(n)
int function5(int n) {
    int count = 0;
    for (int i = 1; i <= n; i++) {</pre>
         count++;
    for (int j = 1; j <= n; j++) {</pre>
         count++;
    }
    return count;
Answer: \theta(n)
```
